

Banking Dashboard

Problem Statement -

The goal of this project is to understand risk analytics in the banking and financial sector and demonstrate how data can be used to reduce the risk of lending. By analyzing customer profiles, financial behavior, and account history, banks can make informed decisions that help minimize credit losses.

Solution -

The Power BI dashboard provides an analytical view of each customer's financial profile. Using the latest Power BI features, the dashboard helps decision-makers evaluate loan applications by identifying whether a customer is likely to repay their loan based on key indicators such as income, deposits, loans, account behavior, and engagement timeline. This allows the bank to make data-driven lending decisions.

About Dataset -

The dataset contains detailed banking information and customer attributes stored across multiple relational tables. These tables are linked using primary and foreign keys.

Key tables include:

- **Banking Relationship**
- **Client-Banking**
- **Gender**
- **Investment Advisor**
- **Period**

Together, these tables describe customer demographics, financial products, advisor relationships, and account behavior over time.

Data Cleaning -

A new calculated column, Engagement Timeframe, was created in the Client-Banking table to represent how long each customer has been associated with the bank. Additional cleaning steps included fixing inconsistent formats, validating relationships between tables, and preparing the dataset for analysis in Power BI.

Banking Dashboard

Engagement Timeframe =

```

1 Engagement Timeframe =
2 SWITCH(TRUE(),
3 'Clients - Banking'[Engagement Days] < 365 , "< 1 Years",
4 'Clients - Banking'[Engagement Days] < 1825 , "< 5 Years",
5 'Clients - Banking'[Engagement Days] < 3650 , "< 10 Years",
6 'Clients - Banking'[Engagement Days] < 7300 , "< 20 Years",
7 "> 20 Years")

```

Processing Fees	Engagement Days	Engagement Timeframe	Income Band	Client ID	Name	Age	Location ID	Joined Bank	Banking Contact	Nationality	Occupation

Creating a new column called *Engagement Days* in the Client-Banking table to calculate the total number of days each client has been associated with the bank, based on their date of joining.

Engagement Days =

```

1 Engagment Days =
2 DATEDIFF('Clients - Banking'[Joined Bank],TODAY(), DAY )

```

Processing Fees	Engagment Days	Engagement Timeframe	Income Band	Client ID
0.05	858	< 5 Years	Mid	IND41067
0.05	725	< 5 Years	Low	IND33193
0.05	8220	> 20 Years	Mid	IND17984
0.05	1161	< 5 Years	Mid	IND34859
0.05	611	< 5 Years	Low	IND55021
0.05	844	< 5 Years	Mid	IND87992
0.05	3351	< 10 Years	Low	IND31796
0.05	1592	< 5 Years	Mid	IND56699
0.05	2639	< 10 Years	Mid	IND35302
0.05	660	< 5 Years	Mid	IND34318
0.05	7214	< 20 Years	Mid	IND79633
0.05	829	< 5 Years	Mid	IND25477

Creating bins for the Estimated Income < 100000 as low and <300000 as Mid with the column named as Income Band in Clients-Banking table.

Banking Dashboard

X ✓

```

1 Income Band =
2 SWITCH(TRUE(),
3 'Clients - Banking'[Estimated Income] < 100000,"Low",
4 'Clients - Banking'[Estimated Income] < 300000,"Mid",
5 "High" )

```

Processing Fees	Engagement Days	Engagement Timeframe	Income Band	Client ID
0.05	2425	< 10 Years	Mid	IND16101
0.05	5966	< 20 Years	Low	IND26283
0.05	1522	< 5 Years	Mid	IND97689
0.05	1669	< 5 Years	High	IND88778
0.05	4100	< 20 Years	Low	IND92423
0.05	7884	> 20 Years	Mid	IND38441
0.05	1610	< 5 Years	Mid	IND79955
0.05	858	< 5 Years	Mid	IND41067
0.05	725	< 5 Years	Low	IND33193
0.05	8220	> 20 Years	Mid	IND17984
0.05	1161	< 5 Years	Mid	IND34859
0.05	611	< 5 Years	Low	IND55021
0.05	844	< 5 Years	Mid	IND87992
0.05	3351	< 10 Years	Low	IND31796
0.05	1592	< 5 Years	Mid	IND56699
0.05	2639	< 10 Years	Mid	IND35302
0.05	660	< 5 Years	Mid	IND34318

Creating a new column named as Processing Fees for the column Fee Structure like if fee structure is high then processing fee would be 0.05

X ✓

```

1 Processing Fees =
2 SWITCH('Clients - Banking'[Fee Structure],
3 "High",0.05,
4 "Mid" ,0.03,
5 "Low" , 0.01 , 0
6 )

```

Processing Fees	Engagement Days	Engagement Timeframe	Income Band
0.05	2425	< 10 Years	Mid
0.05	5966	< 20 Years	Low
0.05	1522	< 5 Years	Mid
0.05	1669	< 5 Years	High
0.05	4100	< 20 Years	Low
0.05	7884	> 20 Years	Mid
0.05	1610	< 5 Years	Mid
0.05	858	< 5 Years	Mid
0.05	725	< 5 Years	Low
0.05	8220	> 20 Years	Mid
0.05	1161	< 5 Years	Mid
0.05	611	< 5 Years	Low

Calculated Functions -

Sum :

The power bi sum function will add all the numbers in a column and the column contains numbers to sum. It returns a decimal number.

Syntax :

Sum= SUM(<column>)

Example:

```
Bank Deposit =  
SUM('Clients - Banking'[Bank Deposits] )
```

DistinctCount :

Counts the number of distinct values in a column

Syntax:

DISTINCTCOUNT(<column>)

Example :

```
Total Clients = DISTINCTCOUNT('Clients - Banking'[Client  
ID] )
```

Sumx :

Returns the sum of an expression evaluated for each row in a table.

Syntax:

SUMX(<table>, <expression>)

Example :

```
Total Fees = SUMX('Clients - Banking' , [Total Loan] *  
'Clients - Banking'[Processing Fees] )
```

Switch :

Banking Dashboard

Evaluates an expression against a list of values and returns one of multiple possible result expressions

Syntax :

```
SWITCH(<expression>, <value>, <result>[, <value>,
<result>]...[, <else>])
```

DATEDIFF :

Returns the number of interval boundaries between two dates.

Syntax :

```
DATEDIFF(<Date1>, <Date2>, <Interval>)
```

Example :

```
Engagement Days = DATEDIFF('Clients - Banking'[Joined Bank], TODAY(), DAY )
```

KPI'S:

In which followings KPI's are present :

Total Clients :

Total Clients KPI represents total number of clients in banking.

```
Total Clients = DISTINCTCOUNT('Clients - Banking'[Client ID] )
```

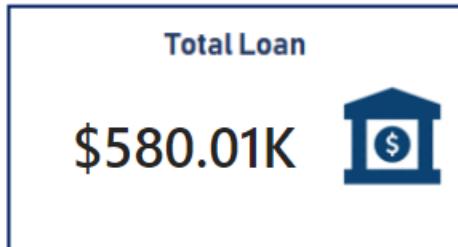

Total Loan :

Banking Dashboard

Total Loan gives you information about the bank loan + Business lending + credit cards balance of particular investor , gender.

Total Loan = [Bank Loan] + [Business Lending] + [Credit Cards Balance]

Bank Loan :

Bank Loan gives you information what is the loan amount of loan to be repaid by the client to bank.

Bank Loan = `SUM('Clients - Banking'[Bank Loans])`

Business Lending :

Business lending gives you information about the loan amount given to small business.

Business Lending = `SUM('Clients - Banking'[Business Lending])`

Total Deposit

Total Deposit gives you information about the amount deposited by particular investors in bank

Total Deposit = [Bank Deposit] + [Savings Account] + [Foreign Currency Account] + [Checking Accounts]

Total Fees :

Total Fees is nothing but the amount charged by the bank for account set-up , maintenance charges etc.

Total Fees = SUMX('Clients - Banking' , [Total Loan] * 'Clients - Banking'[Processing Fees])

Bank Deposit :

Bank deposit is the money put in the bank.

Bank Deposit =
SUM('Clients - Banking'[Bank Deposits])

Checking Account Amount :

Checking account amount is nothing but which offers easy access to your money for daily transactional needs.

Checking Accounts =
`SUM('Clients - Banking'[Checking Accounts])`

Total CC Amount :

Total CC Amount is a short-term source of financing for a company by a bank.

Total CC Amount = `SUM('Clients - Banking'[Amount of Credit Cards])`

Saving Account Amount :

A savings account is an interest-bearing deposit account held at a bank.

Savings Account = `SUM('Clients - Banking'[Saving Accounts])`

Saving Account Amount

\$3.39M

Foreign Currency Amount :

Foreign Currency Account means an account held in a currency that is not the currency of India or Bhutan or Nepal.

Foreign Currency Account =
`SUM('Clients - Banking'[Foreign Currency Account])`

Foreign Currency Amount

\$615.45K

Engagement Account :

Engagement Banking is nothing but puts the customer at the center and aims to deliver the digital experiences they expect.

Engagement Length =
`SUM('Clients - Banking'[Engagement Days])`

Engagement Account

\$5.7K

Credit Cards Balance :

It is the total amount of money currently owned by a cardholder to their credit card bank.

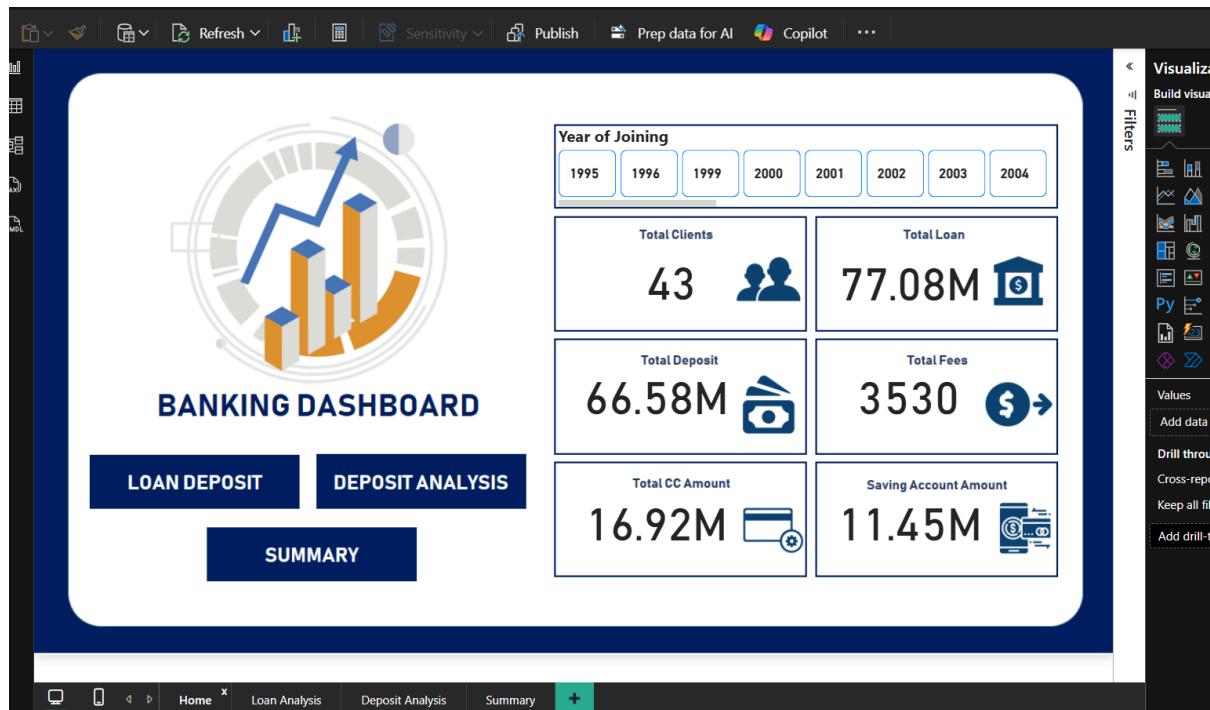

Banking Dashboard

Credit Cards Balance = SUM('Clients - Banking'[Credit Card Balance])

Summary Dashboard

Conclusion

Power BI dashboards, powered by modern data visualization techniques, are highly effective tools for banking analytics. This project demonstrates how key banking metrics and KPIs can be consolidated into an interactive dashboard to support operational decision-making. By organizing customer data, loan information, and deposit behavior into meaningful visuals, banks gain a clearer understanding of risk, customer trends, and financial performance.

Future Work

- The dashboard can help banks quickly evaluate the total loan exposure and other financial details of individual customers.
- Insights on which banking segments attract the most clients (e.g., private banking) can support strategic planning and customer acquisition efforts.
- Nationality-based breakdowns can reveal which demographic groups hold the highest loan amounts, helping target risk assessments.
- The dashboard can be expanded to analyze fund distribution across different account types, providing deeper visibility into client financial portfolios.
